

ETCS Workshop: Basics and practical experience on the ETCS simulator

DESCRIPTION

The European Train Control System (ETCS) is the uniform European train control system. The aim of introducing ETCS is to enable cross-border rail traffic in Europe by means of a uniform system. The basis for the implementation are the EU directives on the interoperability of the trans-European railway system and the technical specifications for interoperability of the structural subsystem control-command and signalling (TSI CCS).

The seminar, prepared in cooperation with MEV Switzerland and AEBt, provides an overview of the history, basic structure and mode of operation of this train control system and illustrates these with the aid of ETCS simulators.

On the first day, we will teach you the theory and legal basics. On the second day, we will offer you the opportunity to deepen your theoretical knowledge in practice with the help of an ETCS simulator.

Seminar-No. 03.08
